

### **Merchants - disconnecting**

Merchants are required to have an ability to disconnect their PayPal accounts from the platform. They are also required to have an ability to reconnect, after disconnecting.

A message along the lines below should be displayed when merchant attempts to disconnect their account:

"Disconnecting your PayPal account will prevent you from offering PayPal services and products on your website. Do you wish to continue?"

As partners themselves can't revoke these permissions, our engineers just ask that the partner "forgets" the associated merchant account so that the merchant can re-onboard with a different account if they choose to. "Forgetting" the merchant would entirely depend on the partner's backend. There's no API or PayPal interaction required here, it's just "delete that row in your database" or whatever is required for the merchant to be able to connect a different PayPal account.

### **Merchants – status**

When checking merchant status, if "primary\_email\_confirmed" is false, a following message should be displayed:

"Attention: Please confirm your email address on <https://www.paypal.com/businessprofile/settings> in order to receive payments! You currently cannot receive payments."

When checking merchant status, if "payments\_receivable" is false, a following message should be displayed:

"Attention: You currently cannot receive payments due to restriction on your PayPal account. Please reach out to PayPal Customer Support or connect to <https://www.paypal.com> for more information."

### **BN Code (PayPal Partner attribution ID)**

Having the BN Code implemented is a required part of the integration, as not implementing this properly would result in a failed configuration. Please find more information about it at the following links: [LINK 1](#) & [LINK 2](#)

(The BN Code is generated by your assigned onboarding specialist)

### **Line item details**

Line item details are required to be passed with every transaction: intent, amount, currency, description of purchase and unique order reference. Please find an example on pages 3 and 4.

### **Shipping / No shipping**

Shipping – The platform is required to have a shipping address validation process in place.  
(e.g. in an event where the buyer enters an invalid address, they are prompted with a message to correct it)

No shipping – If the shipping address isn't required, it should be hidden on the PayPal page (please see a code snippet below, to be implemented in the v2/checkout/orders API call.

```

{
  intent: "CAPTURE",
  purchase_units:
  [
    {
      amount:
      {
        currency_code: 'USD',
        value: '23',
        breakdown:
        {
          item_total:
          {
            currency_code: 'USD',
            value: '17'
          },
          tax_total:
          {
            currency_code: 'USD',
            value: '6'
          }
        }
      }
    },
